Visable signal for tensioning

To get always the correct tensioning of sealing plate at the rotor, we has developed a new system.

The system is showing the tensioning of the sealingplate on a display.

Thereby an exact tensioning is possible!

Result:

Additional wear reduction of sealing plate and rotor, and thereby additional cost reduction by avoiding of operating failure.

A pictogram is showing the selection of tensioning when the correct tensioning is given.

Also it is directly shown how to act for getting the correct tensioning.

The visable signal always is showing during operation the actual given tensioning.

With this system the optimum tensioning is given.
